1. Most patients with a benzodiazepine overdose will respond to a cumulative dose of 1-3 mg of flumazenil, and doses beyond 3 mg do not reliably produce additional effects. On rare occasions, patients with a partial response at 3 mg may require additional titration up to a total dose of 5 mg
2. If a patient has not responded 5 minutes after receiving a cumulative dose of 5 mg of flumazenil, the major cause of sedation is likely not to be due to benzodiazepines, and additional flumazenil is likely to have no effect

・使用於老年人-臨床研究65歲(含)以上受試者不足，老年病人應小心選擇劑量，應以給藥範圍的最低值開始治療；此做法反映出老年人肝臟、腎臟或心臟功能下降，以及共存疾病或其他藥物療法發生率較高的現象，且監測腎功能可能會有幫助。

·Tigecycline is structurally similar to tetracycline class antibiotics and may have similar adverse effects(eg. Photosensitivity, pseudotumor cerebri, pancreatitis, anti-anabolic effects)
·An increase in all-cause mortality has been reported with tigecycline versus comparator antibiotics, especially in ventilator-associated pneumonia (unapproved use), with deaths usually resulting from worsening infection, complications of infection, or underlying comorbidities; reserve use for situations when alternatives are not suitable.
·Increases in total bilirubin concentration, prothrombin time and transaminases have been seen in patients treated with tigecycline. Patients who develop abnormal liver function tests during tigecycline therapy should be monitored for evidence of worsening hepatic function and evaluated for risk/benefit of continuing tigecycline therapy. Hepatic dysfunction may occur after the drug has been discontinued.

· 停用其他具心臟毒性之藥物治療後，再接受anthracycline類藥物治療的病人，發生心臟毒性風險可能會升高。尤其半衰期長的藥物，如trastuzumab可能持續在血液中循環達7個月，故停後7個月內應儘可能避免使用anthracycline類藥物，若在期間內使用，建議應謹慎監測心臟功能。
· 原患有心臟病或因其它疾病有特定臨床表徵(貧血、骨髓抑制、感染、白血病心包膜炎及/或心肌炎)的病人，發生此類心肌毒性風險可能較高。
· anthracycline引發的心肌病變通常會伴隨持續性的QRS波電壓降低、心室收縮時間間隔(PEP/LET)超出正常限值增加以及相較於治療前基準值的左心室射出分率(left ventricular ejection fraction, LVEF)下降。在開始治療前，應先使用心電圖(ECG)和多時閘門心室造影(multiple gated acquisition, MUGA)或心臟超音波(ECHO)評估心臟功能(LVEF評估)。應重複進行MUGA或ECHO以評估LVEF，尤其是使用較高累積劑量時。追蹤過程中，用於評估的技術應保持一致。即早在臨床上診斷出藥物所引發的心肌損傷對藥理治療發揮作用至關重要。

·《Contraindications》History of severe hypersensitivity (eg, anaphylactic reaction) to daratumumab or any of the components of the product

· Premedications: Administer 1-3 hrs prior to each infusion. If dexamethasone is the background regimen-specific corticosteroid, the dexamethasone treatment dose will serve as the corticosteroid premedication on daratumumab infusion days. Additional background regimen-specific corticosteroids (eg, prednisone) should NOT be administered on daratumumab infusion days when patients receive dexamethasone (or equivalent) as a premedication.

- Monotherapy: Methylprednisolone IV 100 mg or equivalent intermediate- or long-acting corticosteroid; following the second infusion, the dose may be decreased (eg, methylprednisolone 60 mg [IV or oral] or equivalent).

- Combination therapy: Dexamethasone 20 mg (or equivalent) prior to each daratumumab infusion; administer IV prior to the first infusion; oral administration may be considered prior to subsequent infusions plus oral antipyretic (acetaminophen 650-1,000 mg) plus oral or IV antihistamine (diphenhydramine 25-50 mg or equivalent).

· Postinfusion medication:

- Monotherapy: Administer an oral intermediate- or long-acting corticosteroid (eg, methylprednisolone 20 mg or equivalent) on the first and second day after all daratumumab infusions.

- Combination therapy: Consider administering low-dose oral methylprednisolone (≦20 mg) or equivalent on the first day after the daratumumab infusion. If dexamethasone or prednisone is administered the day after the daratumumab infusion as part of background combination chemotherapy regimen, additional postinfusion corticosteroid therapy may not be necessary.

- In patients with a history of COPD, also consider short- and long-acting bronchodilators and inhaled corticosteroids postinfusion. If no major infusion reactions occur during the first 4 daratumumab infusions, these additional inhaled postinfusion medications may be discontinued.

·BASAL CELL CARCINOMA: PO, 1.5 to 8.2mg/kg/day with the average dose of 4.6mg/kg/day
·ACNE - SEVERE RECALCITRANT NODULAR: PO, initiated with 0.5 to 2mg/kg/day with food in 2 divided doses for 15 to 20 weeks. If the total cyst count has been reduced by more than 70% during this time period, the drug may be discontinued. The dose should be adjusted according to the appearance of clinical side effects and the response of the disease. A second course of therapy may be initiated 2 months after discontinuation, if the patient experiences persistent or recurring severe nodular acne. In patients who have not completed skeletal growth, the optimal interval before retreatment has not been established; caution should be taken as reports of hyperostosis and premature epiphyseal closure are documented (Prod Info Accutane?, 2000).
·HYPERTROPHIC LUPUS ERYTHEMATOSUS: PO, 1mg/kg/day for 3 weeks resulted in dramatic improvement of lesions, with disappearance of erythema, hyperkeratosis and thickness by 9 weeks; the drug was withdrawn after 11 weeks of treatment and the patient had remained free of occurrence for 9 months.
·KERATINIZATION DISORDERS: PO, Average doses of 2.0mg/kg/day (range 0.5 to 8.0mg/kg/day)

·Use with biologic DMARDs or potent immunosuppressants (eg, cyclosporine, azathioprine) is not recommended.

(1)嚴重感染：
A.治療時，嚴重感染(導致住院或死亡)的風險會升高，包括活動性結核病、侵入性黴菌感染、細菌、病毒或其他伺機性病原體的感染症。
B.治療前，應接受完整結核病篩檢評估，若為活動性結核病人，應先接受結核病藥物治療；若為潛伏性結核感染，須先接受結核病藥物治療連續達9個月。
C.治療前，應進行病毒性肝炎篩檢。
(2)惡性腫瘤與淋巴增生疾病：已患有惡性腫瘤的病人，應權衡治療的風險與效益。在臨床試驗研究中，曾發生淋巴瘤及其他惡性腫瘤的報告。
(3)應監測淋巴球、嗜中性白血球、血紅素及血脂值，因為第3期臨床試驗曾出現這些異常現象。
·接受10mg每日兩次者有較高的風險：嚴重感染、伺機性帶狀皰疹感染、惡性腫瘤(包括實質固態瘤及淋巴瘤)、非黑色素瘤皮膚癌等。

3.仿單內容變更，摘述如下：(版本CDS 20130906-2)
(1)中文品名重量單位標示由"公絲"改為"毫克"。
(2)加註調劑本藥應依管制藥品專用處方箋為之。
(3)禁忌：增列本藥禁止併用ketoconazole、itraconazole、nefazodone及HIV蛋白酉每抑制劑。
(4)藥物交互作用：加註HIV蛋白酉每抑制劑(如ritonavir)與本藥間的交互作用複雜且與用藥時間長短相關。短期低劑量服用ritonavir使得本藥清除率大為減少，排除半衰期延長且臨床效果增強。Triazolam禁止併用HIV蛋白酉每抑制劑。
(5)不良反應：加註協調功能不良、跌倒。
(6)過量：加註曾有呼吸中止的報告。
4.久裕公司來文，Triazolam 0.25mg tab藥品資訊仿單內容變更，摘述如下：(版本 CDS 20170531-2)
(1)Benzodiazepines類藥物併用鴉片類藥物會產生加成的CNS抑制效果，可能引起深度鎮靜、呼吸抑制、昏迷和死亡。應將劑量和療程限制在所需的最低程度。
(2)用於老年及/或虛弱病人，推薦本錠0.125 mg劑量開始治療，以降低出現鎮定過度，頭昏眼花，或協調能力受損的可能。
(3)服用本品可能出現夢遊行為，例如開車、打電話及準備與食用食物。曾有病人服用鎮靜安眠藥(包括triazolam)後，在不完全清醒的狀態下發生複雜的睡眠行為相關事件的報告，例如「夢駕」(即服食鎮靜安眠藥之後，在不完全清醒的狀態下駕駛，事後毫無記憶)。(2018.04.18)
5.仿單內容變更，摘述如下：(版本CDS CDS 20180802-1)
安全性資料增列麻醉和鎮靜藥物的影響-非臨床研究已顯示，在幼年動物腦部發育高峰期間給予阻斷NMDA受體及/或增強GABA活性的麻醉和鎮靜藥物，會增加腦部神經元細胞的死亡，並造成長期的認知和行為缺陷。根據非臨床物種間的比較，這些影響被認為與人類在大腦脆弱期(孕期第三期至出生後第一年間)的接觸有關，而且可能延長至大約3歲。儘管有關本藥影響的資訊有限，但由於作用機制包括增強GABA活性，因此可能產生類似效果。這些非臨床結果於人類用途的相關性仍未知。

1. Contraindications: concurrent antithyroid therapy within 3 to 4 days of radioiodide administration, diarrhea, thyroid malignancies shown to have no iodide uptake (including most medullary and anaplastic carcinomas), vomiting.
2. Females and males of childbearing potential; rule out pregnancy prior to treatment; two effective methods of contraception for at least 6 months after treatment, or longer (eg, one year) if additional sodium iodide I-131 therapy or radionuclide imaging is anticipated, is advised.
3. Thyroiditis may occur and may cause new onset or exacerbation of hyperthyroidism or thyroid storm; consider pretreatment with antithyroid medication in patients with hyperthyroidism and discontinue antithyroid medication at least 3 days prior to administration; also consider beta blocker therapy prior to administration to minimize risk.
4. Renal function impairment; risk of decreased radioiodide excretion and increased radiation exposure; monitoring recommended.
5. Serum chlorides, low; may increase thyroid uptake of sodium iodide.

·Dosing adjustment: 1 prefilled syringe (1500 int unit) prevents maternal sensitization if fetal packed red blood cell volume that has entered the circulation is <15mL (or 30 Ml whole blood); if it is more, give additional vials. The number of vials = RBC volume of the calculated fetomaternal hemorrhage divided by 15.
